SUMMARY

Industrial Engineering student at TU/e working at the intersection of finance, data and software. I build working tools rather than just reports: a published ASML DCF model, an SEC filing analyzer and a demand forecasting system, all with live demos. Seeking internships in supply chain, operations, investment banking or trading/quant.

EDUCATION

Eindhoven University of Technology (TU/e) Eindhoven, Netherlands
B.Sc. Industrial Engineering *Sep. 2025 – May 2028*

- **Relevant Coursework:** Statistics, Data Analytics, Algorithmic Programming, Business Information Systems, Financial & Managerial Accounting

PROJECTS

ASML DCF Valuation Model | *Excel, Python, React* Live demo | GitHub

- Built a ten-year DCF valuation of ASML from 20-F filings, with a bottom-up revenue build (EUV, High-NA EUV and DUV units × ASP) and a five-year fade to a 2.5% terminal growth rate.
- Estimated a 9.4% WACC via CAPM and bottom-up beta; valued the firm with Gordon Growth and exit-multiple methods, cross-checked against trading comps (AMAT, LRCX, KLAC, TEL) and a reverse DCF.
- Ran 9×9 sensitivity grids and Bear/Base/Bull scenarios, arriving at EUR 935 per share (42% below market); automated 27 model-integrity checks in Python and published the model as an interactive site.

SEC Filing Analyzer | *Python, FastAPI, React, TypeScript, LLMs* Live demo | GitHub

- Built a full-stack tool that pulls 10-K and 10-Q filings from SEC EDGAR and uses an LLM to extract key risks, growth opportunities and management priorities, each backed by a quote from the filing.
- Computed revenue, margins and YoY growth directly from XBRL data, so the LLM never generates a financial figure.
- Added filing-to-filing comparison flagging new, removed and escalated risks; runs free on a local LLM (Ollama).
- Fixed a silent data bug: NVIDIA changed its XBRL revenue tag after FY2022, dropping four years of revenue.

Demand Forecaster | *Python, XGBoost, SARIMA, Streamlit* Live demo | GitHub

- Forecast daily demand for 500 products (10 stores × 50 items, five years of sales) with a global XGBoost model using lag, rolling and calendar features.
- Beat a seasonal-naive benchmark by 26% (MASE 0.74, MAPE 13.6%) and a SARIMA baseline (MAPE 33.4%).
- Turned forecasts into inventory decisions (safety stock, reorder point and order quantity per product by service level), flagging 178 of 500 products at stockout risk over a 14-day lead time.

Discount Policy Simulator | *Python, pandas, SQL, JavaScript* Live demo | GitHub

- Analyzed 51,290 Superstore order lines in Python and SQL to measure how discounts affect profit margin.
- Found every category loses money above a 20% discount: these lines lost $815K (81% of loss-making lines).
- Built an interactive simulator showing a 20% discount cap would raise profit from $1.47M to $2.28M–$2.50M, depending on customer retention.

SKILLS & INTERESTS

Programming: Python, SQL, JavaScript, TypeScript, Dart
Web & App Development: React, FastAPI, Node.js, Flutter, Firebase, Tailwind CSS
Data & Analytics: pandas, XGBoost, SARIMA, Streamlit, LLM APIs (Ollama, OpenAI)
Financial Modeling: Excel, DCF Valuation, WACC, Trading Comparables, Sensitivity & Scenario Analysis
Tools: Git, GitHub
Languages: Turkish (Native), English (C1), Dutch (A1)
Interests: Tennis, Padel, Fitness, Personal Investing & Financial Markets
